GROWTH PROMOTION

Background of the Invention

The chemistry and use of β -phenethanolamines has been extensively investigated. A number of these compounds have been reported to have beneficial cardiac activities; see U.S. Patent No. 3,987,200. Such compounds also are known to have sympathomimetic activity, and have found utility as utero-relaxing agents; Van Dijk et al., Recueil, 92, 1281 (1973). More recently, a group of β -phenethanolamines have been reported as possessing anti-hyperglycemic activity, and have been found effective in promoting the loss of weight in animals, EPO 6735 published January 9, 1980.

An object of this invention is to provide a new use for certain β -phenethanolamines. This invention provides a method for promoting the growth of domesticated animals employing β -phenethanolamines.

Summary of the Invention

This invention provides a method for increasing weight gain in animals and improving the efficiency of feed utilization and the quality of the carcass. The invention is more particularly directed to a method for promoting growth and improving feed efficiency and leanness comprising administering an effective amount of a compound having the formula

TOOZOX

10

15

20

25

30

POH IN

118

wherein:

R¹ is hydrogen, hydroxy, or methoxy;
R² is hydrogen or fluoro,
R³ is hydrogen or C₁-C₂ alkyl;
R⁴is hydrogen or methyl;

 R^5 is hydrogen, fluoro, nitro, hydroxy, SO_2CH_3 or $CONH_2$; provided that R^1 is hydrogen only when R^5 is nitro or SO_2CH_3 ; and the acid addition salts thereof.

A preferred method for promoting growth and improving feed efficency and leanness according to this invention employs a compound of the above formula wherein R¹ is hydroxy, R² is hydrogen, R³ is hydrogen or methyl and R⁴ is methyl. The method is most preferably practiced employing a compound wherein R¹ and R⁵ both are hydroxy and R² and R³ both are hydrogen and R⁴ is methyl. When R¹ is hydroxy or methoxy, it preferably is in the para position. When R⁵ is other than hydrogen, it also is preferably in the para position.

This invention also provides an animal feed-stuff comprising a β -phenethanolamine of the above formula together with a suitable carrier therefor.

Detailed Description of the Invention

The compounds employed in the method provided by this invention are either known in the art or are readily prepared by well known synthetic procedures. A particularly preferred method employs 1-(3-hydroxy-phenyl)-2-[1-methyl-3-(4-hydroxyphenyl)propylamino]-ethanol. This β-phenethanolamine is disclosed in South

African Patent No. 673,994 published in May, 1967. The most preferred embodiment of this invention employs 1-(4-hydroxyphenyl)-2-[1-methyl-3-(4-hydroxyphenyl)-propylamino]ethanol, a compound disclosed as having attero-relaxing activity by Van Dijk et al. in Recueil, 92 1281 (1973).

The compounds to be employed in the method of this invention are readily prepared by reaction of a styrene oxide with a 3-phenylpropylamine derivative.

- 10 For example, a styrene oxide such as 2-fluorostyrene oxide can be reacted with about an equimolar quantity of an amine such as 1-methyl-3-(4-nitrophenyl)propylamine in an unreactive organic solvent such as ethanol, methanol, n-propanol, dioxane, or the like. The reac-
- 15 tion generally is carried out at a temperature of about 50 to about $120\,^{\circ}\text{C.}$, and at such temperature the reaction routinely is substantially complete within about 6 to about 10 hours. The product, a β -phenethanolamine, is readily isolated by simply removing the reaction
- 20 solvent, for instance by evaporation under reduced pressure, and further purification can be accomplished if desired by standard techniques, including crystallization, chromatography, acid-base extraction, and the like.
- 25 An alternative method for preparing the β-phenethanolamines to be employed in the present method comprises reacting a mandelic acid derivative with a 3-phenylpropylamine derivative to provide an amide, which upon subsequent reduction provides a compound of 30 the above formula. For example, a phenylpropylamine

x-5683

derivative such as 1-methyl-3-(3-fluorophenyl)propylamine can be reacted with an acylating agent such as a hydroxy protected mandelic acid halide, or preferably simply reacted with a mandelic acid in the presence of

- 5 a common peptide coupling reagent such as N,N'-di-cyclohexylcarbodiimide, carbonyldiimidazole, N-ethoxy-carbonyl-2-ethoxy-1,2-dihydroquinoline, commonly referred to as EEDQ. The direct coupling reaction generally is conducted in an organic solvent such as
- 10 benzene or N,N-dimethylformamide, and normally is complete after about 2 to 48 hours when carried out at about -30 to about 100°C. The product is an amide that is readily isolated by simply filtering the reaction mixture and then removing the reaction solvent. The
- 15 amide thus formed is next reduced by reaction with a common reducing agent such as diborane or the like to provide a β -phenethanolamine defined by the above formula.

A similar, yet alternative, method of syn
20 thesis comprises reacting a phenethanolamine with a
phenylethyl ketone to provide a Schiff base, which upon
reduction gives a compound to be employed in the
present method. For example, a phenethanolamine such
as 2-hydroxy-2-(4-hydroxyphenyl)ethylamine can be

- 25 reacted with a ketone such as methyl 2-(4-hydroxy-phenyl)ethyl ketone to provide the corresponding imine, which upon reduction, for instance with 5% palladium on carbon, provides 1-(4-hydroxyphenyl)-2-[1-methyl-3-(4-hydroxyphenyl)propylamino]ethanol.
- It should be noted that the compounds to be employed in the method of this invention possess at

x-5683 -5-

least one asymmetric center (i.e. the carbinol center), and when R³ and R⁴ differ, the compounds possess two asymmetric centers. Since employment of individual optical isomers necessitates preparing the β-phenethanolamines from optically active starting materials, or using costly separation procedures, a preferred embodiment of this invention employs a mixture of optical isomers. For example, 1-(4-hydroxyphenyl)-2-[1-methyl-3-(4-hydroxyphenyl)propylamino]ethanol is 10 preferably prepared from racemic mixtures of starting materials, e.g. dl-l-methyl-3-(4-hydroxyphenyl)propylamine and dl-4-hydroxystyrene oxide, to provide a

15 the method without subsequent separation of isomers. Since the β -phenethanolamines to be employed in the present method are inherently basic, they readily form acid addition salts with any number of inorganic and organic acids. These salts can be employed in the

The mixture of optical isomers is employed in

mixture of all four possible optical isomers of the

20 method of the invention, and often are preferred to the free base since they generally are more soluble in solvents such as water and are more conveniently formulated as an animal feedstuff. Acids commonly employed to form acid addition salts include mineral acids such

25 as hydrochloric acid, sulfuric acid, phosphoric acid, perchloric acid and the like; and organic acids such as acetic acid, citric acid, succinic acid, para-toluene

20

25

P.

Pa

sulfonic acid, methanesulfonic acid, lactic acid and the like. Preferred salts to be employed in the present method include the hydrochlorides and hydrobromides.

5 Typical β -phenethanolamines to be employed in the method of this invention include the following:

1-(3-hydroxyphenyl)-2-[1-methyl-1-ethyl-3-(4aminocarbonylphenyl)propylamino]ethanol;

1-(2-fluoro-4-hydroxyphenyl)-2-[1-methyl-3-(4fluorophenyl)propylamino]ethanol;

1-(4-hydroxyphenyl)-2-[3-(3-nitrophenyl)propylamino]ethanol;

1-(3-hydroxy-2-fluoropheny1)-2-[3-(4-methy1sulfony1)propylamino]ethanol;

15 l-(4-methoxyphenyl)-2-[1-methyl-3-(4-hydroxy-phenyl)propylamino]ethanol;

l-phenyl-2-[1,l-dimethyl-3-(3-methylsulfonylphenyl)propylamino]ethanol;

1-(4-hydroxyphenyl)-2-[1,1-dimethyl-3-(4-

hydroxyphenyl)propylamino]ethanol hydrochloride;

1-(phenyl)-2-[1-methyl-3-(4-nitrophenyl)propylamino]ethanol;

1-(3-hydroxyphenyl)-2-[1-methyl-3-(4-fluorophenyl)propylamino]ethanol succinate;

1-(4-hydroxypheny1)-2-[1-methy1-1-ethy1-3-(4-aminocarbonylpheny1)propylamino]ethanol;

1-(4-hydroxyphenyl)-2-[1,1-dimethyl-3-phenylpropylamino]ethanol hydrobromide; and

d-1-(4-hydroxyphenyl)-2-[1,1-dimethyl-330 (4-hydroxyphenyl) propylamino] ethanol.

•

X-5683 -7-

The method of promoting growth and improving leanness and feed efficiency provided by this invention is practiced by administering an effective amount of a compound defined above to a warm-blooded animal that receives a nutritionally adequate diet. The method generally will be practiced on domesticated animals raised for human meat consumption, for example grower/finisher swine, poultry, ruminants and the like. In a preferred embodiment, the growth of pigs, chickens and turkeys is promoted employing a β-phenethanolamine.

- Another preferred embodiment is practiced in ruminants such as cattle, sheep and goats. The method of improving leanness is not limited to meat producing animals, and can be practiced on other warm-blooded animals, in-
- 15 cluding dogs and cats. This latter embodiment is particularly useful when it is desired to maintain mature animals in a relatively lean physical state.

practiced by orally administering an effective amount 20 of a β -phenethanolamine to an animal. Other routes of administration can be employed, for instance intramuscular or intravenious injection; however, such routes are less practical. The amount to be administered to an animal is an amount that is effective in causing

The method of the invention is preferably

- 25 a promotion of growth, or an improvement in the efficiency of utilization of food, or an improvement in carcass quality of the animal, for instance in the form of less fatty tissue and improved leanness. The effective amount to be administered will vary somewhat
- 30 depending upon the particular animal species being treated and the particular active ingredient employed,

x-5683

62

but generally will be from about 1 to about 1000 parts per million (ppm) of total daily feed intake. Such amount will provide a dosage of about 0.05 to about 50 mg/kg. A preferred embodiment employs about 1 to about 200 ppm, and more preferably from about 5 to about 100 ppm. A typical amount of active ingredient to be administered to swine will be from about 5 to about 40 ppm. For example, when practicing the method in animals such as ruminants or swine, the compound

10 will be added to the daily feed ration at about 5 to about 100 parts per million of the daily feed ration.

For oral administration, the active β-phenethanolamine is preferably admixed with suitable carriers or diluents commonly employed in animal

- 15 husbandry. Animal feedstuffs comprising a β-phenethanolamine growth promoter as defined herein are provided as a further embodiment of this invention. Typical carriers and diluents commonly employed in such feedstuffs include corn meal, soybean meal, alfalfa
- 20 meal, rice hulls, soybean mill run, cottonseed oil meal, bone meal, ground corn, corncob meal, sodium chloride, urea, cane molasses and the like. Such carriers promote a uniform distribution of the active ingredient in the finished feed ration into which such
- compositions are added, thereby ensuring proper distribution of the active ingredient throughout the feed. The feedstuff composition provided by the invention will contain about 5 to about 95 percent by weight of active ingredient, and more typically about 10 to about
- 30 50 percent by weight. As already noted, the acid

X-5683 -9-

5

10

15

20

addition salts of the active phenethanolamines are generally preferred for oral administration, and are thus the preferred form of active ingredient for the feedstuff compositions of the invention.

While the preferred method for orally administering the growth promoters is via the daily feed rations, the compounds can be incorporated into salt blocks and mineral licks, as well as being added directly to drinking water for convenient oral consumption. The compounds can additionally be formulated with polymorphous materials, waxes and the like for long-term controlled release, and administered to an animal as a bolus or tablet only as needed to maintain the desired daily payout of active ingredient.

For parenteral administration, the β-phenethanolamines can be admixed with conventional carriers such as corn oil, sesame oil, carbowax, calcium stearate and the like. Such formulations can be molded into pellets and administered as an injection or as a slow-release subcutaneous implant. Such administrations can be made as often as needed to ensure the proper dosing of active ingredient to obtain the desired rate of growth promotion and improvement in leanness and feed efficiency.

25 While the compounds described herein are effective in promoting average daily weight gain and improving feed efficiency in animals, they also cause observable improvement in the quality of the meat produced. For example, the compounds appear to mobilize free fatty acids from fatty tissue and depress the

x-5683 -10-

deposition of fat as the animals gain weight. This reduction of fat is beneficial since the animal being treated according to the invention gains weight in the form of more useable lean meat, thereby reducing waste and improving the value of the animal thus treated. Also, mature animals that are not subject to additional weight gain can be maintained in a desirably lean form by administering a compound as described herein.

The practice of the present invention is more fully illustrated by the following detailed examples.

Example 1

Preparation of d1-4-(benzyloxy) mandelic acid

A solution of 5.0 g of dl-4-hydroxy mandelic acid, 11.0 g of benzyl chloride and 10.0 g of potassium carbonate in 50 ml of methanol was heated to reflux and stirred for seventy-two hours. The reaction mixture was cooled to room temperature and diluted with 50 ml of water. The aqueous solution was washed twice with 50 ml portions of benzene, and then was acidified with concentrated hydrochloric acid. The aqueous acid solution was extracted three times with 50 ml portions of ethyl acetate. The organic extracts were combined, washed with water and with saturated sodium chloride solution and dried. Removal of the solvent by evaporation under reduced pressure provided 5.7 g of a solid which was then recrystallized from 300 ml of toluene to afford 5.33 g of dl-4-(benzyloxy) mandelic acid. 153-155°C.

Example 11

1-(3-Hydroxyphenyl)-2-[1,1-dimethyl-3-(4-fluorophenyl)propylamino]ethanol

To a stirred solution of 67.2 g. (0.22 M) of 5 2-(3-benzyloxyphenyl)-2-oxoethyl bromide in 200 ml. of acetonitrile was added a solution of 54.3 g. (0.20 M) of N-benzyl-1,1-dimethyl-3-(4-fluorophenyl) propylamine in 600 ml. of acetonitrile containing 42 ml. (0.22 M) of diisopropylethylamine. The reaction mixture was 10 stirred for about six hours at reflux, and then was cooled and stored at room temperature for forty-eight The reaction mixture was next diluted by addition of aqueous sodium hydroxide, and the organic solvents were removed by evaporation under reduced 15 pressure. The aqueous alkaline mixture was extracted with ethyl acetate, which was then washed with water, dried, and concentrated to dryness to give an oil. oil was dissolved in ethanol and diethyl ether and converted to the hydrochloride salt by addition of 20 excess hydrogen chloride. The precipitated solid was collected by filtration and recrystallized from ethyl acetate to give 51.3 g. of 1-(3-benzyloxyphenyl)-1-oxo-2-[(N-benzyl)-1,1-dimethyl-3-(4-fluorophenyl)propylamino]ethane hydrochloride. M.P. 137-145°C. 25

The compound thus prepared was reduced by reaction with 16 g. of sodium borohydride in ethanol. Isolation of the product, followed by conversion to the hydrochloride salt and crystallization from diethyl ether afforded 55.0 g. of 1-(3-benzyloxyphenyl)-2-[(N-benzyl)-1,1-dimethyl-3-(4-fluorophenyl)propyl-amino]ethanol hydrochloride. M.P. 186.5-191°C.

•

15

A solution of 10.0 g. of the product thus produced in 200 ml. of ethanol containing 3.0 g. of Raney Nickel was shaken for two hours at 25°C. under hydrogen at 44 psi. The reaction mixture was then filtered, and the solvent was removed from the filtrate by evaporation under reduced pressure to give a white solid. The solid was triturated with ethyl acetate and air dried to provide 5.9 g. of 1-(3-hydroxyphenyl)-2-[1,1-dimethyl-3-(4-fluorophenyl)propylamino]ethanol hydrochloride. M.P. 196.5-198.5°C.

The compounds to be employed in the method of this invention have demonstrated efficacy in animal tests designed to establish beneficial nutritional effects. In one test designed to show lipolytic activity, normal swine, either barrows or gilts, were employed to analyze the effect of compounds on blood glucose, insulin, and non-esterified fatty acids (NEFA).

Test animals were maintained in metabolism crates, and following a period of adaptation, catheters

10 were placed in their femoral veins. Prior to administration of the test compounds, all animals were fasted for a period of forty hours. Such fasting causes an elevation of NEFA's in the blood. On the day of the test, all animals were fed a normal feed ration, and

- 15 one group of animals were held as controls while another group of animals received a test compound. The test compounds were administered at 200 mcg/kg intravenously, or orally at 1 mg/kg. Blood samples were taken from each animal immediately prior to treatment
- 20 and then at one hour intervals for a period of six hours following treatment. The blood plasma was analyzed for glucose, insulin and NEFA content.

When the fasted pigs were fed the normal feed ration without a test compound, the NEFA levels in the 25 blood drop dramatically and remained low. A β-phenethanolamine as defined herein caused either an elevation in NEFA's, or inhibited the drop in NEFA's. Blood levels of glucose and insulin were also elevated with the β-phenethanolamines.

The following Table presents the lipolytic activity of several preferred β -phenethanolamines when evaluated according to the test described above. The results are averages of several tests.

T0310X

A ten day <u>in vivo</u> study was employed to determine the effect of β-phenethanolamines on feed efficiency and rate of growth. In these studies, barrows and gilts weighing approximately 60 kg were maintained in individual pens. Each treatment was replicated six times in randomly assigned animals, with each test animal forming an experimental unit. A group of control animals received a normal swine grower feed ration comprising the following ingredients:

10	Ingredient	% by weight
	Ground yellow corn	76.70
	Soybean oil meal	. 19.35

T0320X

The test animals received the same feed ration plus the test compound. All animals received feed and water ad libitum. All animals were weighed on day 1 and again on day 10, and feed consumption was measured by recording all feed issued and any remaining feed on day 10. The results of two series of this 10 day test for several β-phenethanolamines are given in Table II. In the Table, the column labelled "ADG" is the average daily weight gain in pounds; "ADF" is the average daily feed consumption (in pounds) by the test animals; and F/G is the feed efficiency calculated as ADF divided by ADG.

x-5683

· (-) The β-phenethanolamines to be employed in the method of this invention can be administered in combination with other compounds known to have a beneficial effect upon animals. Typical compounds to be co-administered with the β-phenethanolamines include antibiotics, for example any of the tetracyclines, tylosin, penicillins, cephalosporins, polyether antibiotics, glycopeptides, orthosomycins and related compounds commonly administered to swine, poultry,

- 10 ruminants and the like. A preferred combination to be employed in the present method is an antibiotic such as tylosin or a tetracycline, together with 1-(4-hydroxy-phenyl)-2-[1-methyl-3-(4-hydroxyphenyl)propylamino]-ethanol. Such combinations will comprise the respec-
- 15 tive components in a ratio of about 1 to about 2 parts by weight of β -phenethanolamine and about 1 to about 10 parts by weight of the partner component.

In a typical treatment, l-(4-hydroxyphenyl)-2-[1-methyl-3-(4-hydroxyphenyl)propylamino]ethanol was

- 20 evaluated in a 42-day study employing finishing swine. Each treatment was replicated four times, with three pigs per replication. All treatments included a normal feed diet plus tylosin at 40 g/T. The animals were tested for growth performance and feed efficiency
- 25 enhancement. Carcass quality was determined by analysis for fat and muscling. The results of the study are given in Table III. Both β -phenethanolamine treatments resulted in improved growth performance and carcasses with less fat and more muscle.

¹ These results are based upon measurement of fat at the 10th rib after the carcass is split in half across the backbone.

²A regression equation is employed in arriving at the numerical predictions of carcass muscle (J. Animal Science, 1977, Vol. 44:8-17).

x-5683 -36-

As in the previous study, both phenethanolamine treatments resulted in carcasses with less fat and more muscle. It should also be noted that the estimated amount of carcass muscle produced with the Tylosin +A treatment was similar to that produced in the control and the Tylosin treatment alone. This result was achieved, however, with less feed consumption than either the control or the Tylosin treatments.

Additional studies have been carried out to demonstrate the anabolic effect of β -phenethanolamines in swine. The effect of the compounds on nitrogen retention in finishing barrows was determined. Nitrogen retention is the difference between nitrogen intake and nitrogen excreted. Increased nitrogen retention is known to be associated with increased anabolic activity, resulting in improved carcass muscling and leanness.

In a typical study, barrows weighing about 172 pounds (78 Kg) were orally administered various doses of 1-(4-hydroxyphenyl)-2-[1-methyl-3-(4-hydroxyphenyl)propylamino]ethanol hydrochloride (Compound A). All animals received water and a constant amount of normal swine feed ration. The results of this study are presented in Table V, and show that all β -phenethanolamine treatments improved nitrogen retention compared to controls.

Table V

	Nitro	ogen Retention Animals per treatment	Nitrogen Retained (g/day)

The data in Table VI demonstrates that the method of improving feed efficiency and promoting growth can be practiced with any desired mixture of β -phenethanolämine optical isomers.

The efficacy of the β -phenethanolamines described herein also has been demonstrated in poultry. In a typical study, broilers that were twenty-one days old were administered an oral dosing of a β -phenethanolamine in their normal daily feed ration. All animals received the following broiler finisher ration:

	Ingredients	% by weight	lbs/T
	Ground yellow corn	66.40	1328.00
	Animal-vegetable fat	1.53	30.60

The compounds of the invention also have demonstrated efficacy in ruminants. Forty-eight cross-bred wether lambs were employed in a test designed to show the effects of Compound A (1-(4-hydroxyphenyl)-2-[1-methyl-3-(4-hydroxyphenyl)propylamino]ethanol hydrochloride) at varying doses. Sixteen animals were held as controls, while sixteen received 40 ppm of Compound A, and another sixteen received 80 ppm of Compound A. All animals received a normal daily feed ration and water ad libitum. Average daily weight gain and average daily feed consumption after twenty-eight days is given below in Table VIII. The data demonstrates that a β-phenethanolamine as defined herein is effective in promoting growth and improving feed efficiency in ruminants.

Table VIII

Growth Performance of Lambs

	Treatment	Dose (ppm)	ADG (1bs)	ADF (lbs)	F/G	
25	Control	0	0.414	3.68	8.89	
	Compound A	40	0.418	3.61	8.64	
	Compound A	80	0.472	3.57	7.56
